

ABSTRACT OF THE DISCLOSURE

A first panel element and a second panel element, each having at least one display layer, are positioned and opposed to each other. The 5 elements are progressively adhered from a starting position with an adhesive material supplied beforehand. Examples of the adhesive material include those which are in a liquid state before curing (such as photo-curing adhesive materials), 10 and also include adhesive sheets. The adhesive material having fluidity can be spread between the two panel elements in the adhering step.
